RESOURCE LIST

INFANT MATERIALS

Infant and toddler materials stimulate sensory exploration, encourage developmental milestones, and promote cognitive and physical growth in babies.

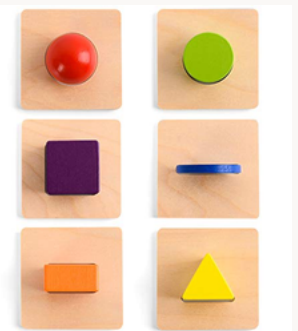

FINE MOTOR AND COGNITIVE

Fine motor activities like threading beads, fabric, cutting with scissors, or stacking small objects strengthen hand-eye coordination, precision, and dexterity. These tasks also require focus, planning, and decision-making, fostering cognitive growth.

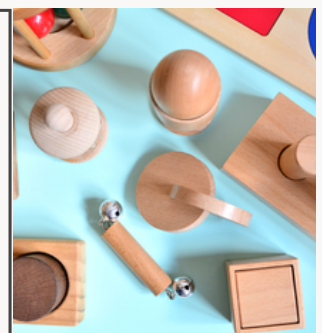

INFANT CAUSE AND EFFECT

Cause-and-effect experiences are essential for children's cognitive development, as they begin to understand how their actions can create reactions. Infants start to develop problem-solving skills, object permanence, and the ability to predict what might happen next.

SHAPE SORTERS

These toys encourage infants to match shapes to their corresponding holes, enhancing fine motor skills, hand-eye coordination, and cognitive development by improving shape recognition.
